

Every mode was run in every cell — the grid is complete, so every comparison is paired

48 conditions over 8 cells. A **condition** is one (site, model, mode) launch unit — one square. A **cell** is one (site, model) stratification unit — one column. Squares carry task success rate (%); colour marks what is actually sent to the model. Within a column all six modes run the identical scored task-ID set.

Source: docs/analysis/cross_sites/router_objective_ordering.md, cross-checked against sr_per_mode.json (script refuses to plot on disagreement). VWA shopping conditions exist but are excluded from analysis (they predate pipeline corrections) and are not shown.
